

SWENG Assignment 1

Sheena O'Reilly - 20332712

Eimear Ryan - 20332642

- We first met up in person on the 30th of September to make a start on the assignment
- Sheena created the git repository and called it sweng assignment , we realised that as we didnt add a readme file there were no branches
- Eimear then added a readme file through the command prompt which create a master branch
- We then created 3 branches the development branch, a branch for Sheena's code and a branch for Eimear's code
- The idea was the we would combine our code in the development branch and push that to the main once we had fixed any bugs or issues
- We decided that Sheena would work on creating a function for the different operators and Eimear would work on checking if the string entered by the user was valid
- Sheena linked the first java files to the repository
- We decided we would meet again in a few days to check on the status of our project and start combining our code
- Due to technical difficulties with Sheena's java application she had to remake the repository and the java files
- Sheena added the java test file for the operators and created a test for all the functions and pushed it to the sheena branch
- Sheena added the functions for the operators into the java files and then pushed this to the sheena branch
- Eimear added the java test file for the validity of the string and created a test for all the functions and pushed it to the sheena branch
- Eimear added the class to check if it was a valid string and added it to the Eimear branch
- Eimear then started on getting maven to work but encountered some difficulty so decided it was better to create a new repository creating maven from the start
- We then met up on the 7th of october a week after the first meet up and realised we had a gap in our code
- Eimear checked if the string was valid and Sheena's functions took in two integers and returned the result for each operator
- We had to find a way to break the string into sections to be passed into Sheena's functions
- We brainstormed ideas, We thought of using a stack or using arrays.split but decided to use array lists
- Eimear worked on the code for the array lists in the development branch
- Sheena linked all three bits of code together and created the test files for the calculator in the development branch
- Sheena merged all the code we had done into the main branch and wrote report
